Supply Chain & Logistics Performance Analysis

Anil Kumar | Aspiring Data Analyst

Python | SQL | Power BI

Made with GAMMA

Supply chain performance is spread across different areas

Data is spread across products, inventory, suppliers, shipping, manufacturing, and quality checks.

Which products generate the most revenue?

Which products have the highest demand?

Does inventory match demand?

Which suppliers take longer to deliver?

Where can shipping be improved?

Which products have quality or defect problems?

Made with GAMMA

Turn data into decisions you can act on

Turn supply chain and operations data into findings that lead to better decisions on inventory, suppliers, manufacturing, shipping, and product quality.

Made with GAMMA

From raw data to business recommendations

01

Raw Dataset:

gather records from daily operations.

02

Python:

prepare, clean, reshape, and analyze data.

03

SQL / MySQL:

explore the data and answer business questions.

04

Power BI:

build interactive dashboards with key numbers.

05

Insights:

turn patterns into help for decisions.

06

Recommendations:

focus effort on the most valuable opportunities.

Made with GAMMA

Executive Overview connects the full set of key numbers

Total Revenue: approximately ₹577.60K

Total Products Sold: approximately 46K

Average Stock Level: 48

Average Defect Rate: 2.28%

Overview of revenue, demand, inventory, results by location, defect rates, and transportation.

Made with GAMMA

Stock and delivery data shows where problems may start

Stock levels by product type

Shipping cost by carrier

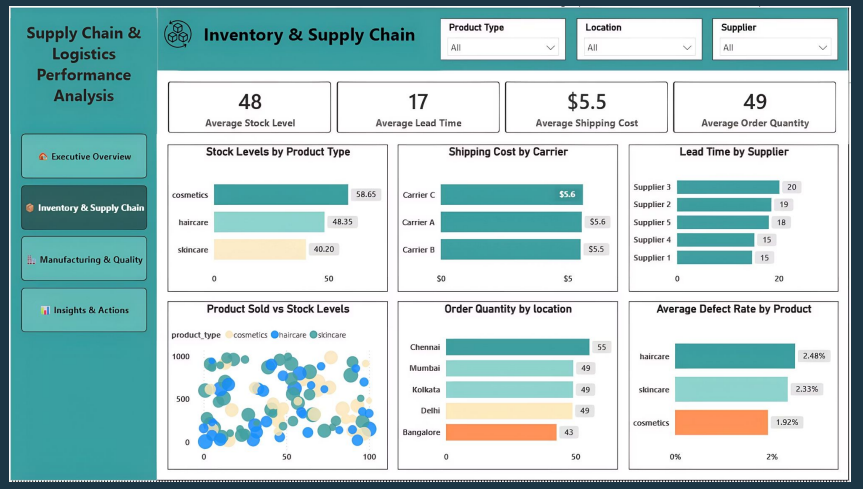

How long suppliers take to deliver

Products sold vs. stock on hand

Order quantity by location

Average defect rate by product

Use the dashboard to spot stock risks, supplier delays, shipping cost savings, and demand patterns.

Made with GAMMA

Making products and checking quality show where to improve

Units produced

Cost to make

Time to make

Revenue by supplier

Share of faulty products

Quality check results

Key finding: Haircare had the highest share of faulty products, at about 2.48%.

Made with GAMMA

The clearest patterns involve demand, quality, and supplies

Revenue: Skincare brought in the most revenue, at about ₹0.24M.

Demand: Skincare sold the most units, at about 21K.

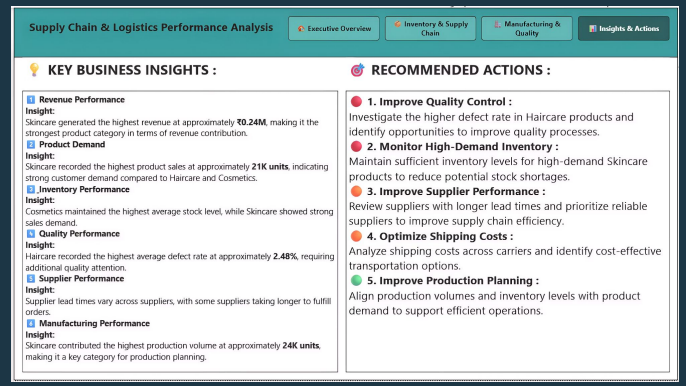

Inventory: Cosmetics kept the highest average stock level.

Quality: Haircare had the highest share of faulty products, at about 2.48%.

Suppliers: Delivery times varied, so there is room for suppliers to do better.

Manufacturing: Skincare made the most units, at about 24K.

These findings show patterns in the data and help guide decisions.

Made with GAMMA

Turn the findings into clear actions

Check quality more closely for Haircare products.

Keep a close eye on stock for popular Skincare products.

Review suppliers with longer delivery times.

Compare shipping costs and find cheaper carrier options.

Match production and stock levels to what customers buy.

Why it matters

This project turns raw data into one simple tool. It helps people spot patterns, risks, and chances to improve.
